1. (15 pts) In $S_{10}$, let $\alpha = (1,3,5,7,9)$, $\beta = (1,2,6)$, and $\gamma = (1,2,5,3)$. For $\sigma = \alpha \beta \gamma$, write $\sigma$ as a product of disjoint cycles, and use this to find its order and its inverse. Is $\sigma$ even or odd?

Solution: We have $\sigma = (1,6,3,2,7,9)$, so $\sigma$ has order 6, and $\sigma^{-1} = (1,9,7,2,3,6)$. Since $\sigma$ has length 6, it can be written as a product of 5 transpositions, so it is an odd permutation.

2. (10 pts) State the definition of a group.

3. (10 pts) Let $f : \mathbb{Z}_{12} \to \mathbb{Z}_{12}$ by $f([x]_{12}) = [x^2]_{12}$, for all $[x]_{12} \in \mathbb{Z}_{12}$. Show that the formula $f$ defines a function. Find the image of $f$ and the set $\mathbb{Z}_{12}/f$ of equivalence classes determined by $f$.

Solution: The formula for $f$ is well-defined since if $[x]_{12} = [x^2]_{12}$, then $x_1 \equiv x_2 \pmod{12}$, and so $x_1^2 \equiv x_2^2 \pmod{12}$, which shows that $f([x]_{12}) = f([x^2]_{12})$.

To compute the images of $f$ we have $[0]_{12}^2 = [0]_{12}, [\pm 1]_{12}^2 = [1]_{12}, [\pm 2]_{12}^2 = [4]_{12}, [\pm 3]_{12}^2 = [9]_{12}, [\pm 4]_{12}^2 = [4]_{12}, [\pm 5]_{12}^2 = [1]_{12},$ and $[6]_{12}^2 = [0]_{12}$. Thus $f(\mathbb{Z}_{12}) = \{[0]_{12}, [1]_{12}, [4]_{12}, [9]_{12}\}$. The corresponding equivalence classes determined by $f$ are $\{[0]_{12}, [1]_{12}, [4]_{12}, [9]_{12}\}$.

3. (10 pts) Let $f : S \to T$ be a function. Complete these definitions:

(a) The function $f$ is one-to-one if $\ldots$

(b) The function $f$ is onto if $\ldots$

4. (15 pts) Let $f : S \to T$ and $g : T \to U$ be functions, and assume that $f$ is onto. Show that the composition $g \circ f$ is onto if and only if $g$ is onto.

Solution: If $g$ is onto, then given any $u \in U \exists t \in T$ with $g(t) = u$, and since $f$ is onto $\exists s \in S$ with $f(s) = t$. Thus $u = g(t) = g(f(s)) = g \circ f(s)$.

If $g \circ f$ is onto, and $u \in U$, then $\exists s \in S$ with $g \circ f(s) = u$. Thus $u = g(f(s))$, and so $g$ is onto.

5. (15 pts) If $A$ and $B$ are $n \times n$ matrices, we say that $B$ is similar to $A$, written $B \sim A$, if there exists an invertible $n \times n$ matrix $P$ such that $B = P^{-1}AP$. Show that this relation $\sim$ is an equivalence relation on the set of all $n \times n$ matrices. (That is, check the reflexive, symmetric, and transitive laws.)

Solution: For any $A$, we have $I^{-1}AI = A$. If $A \sim B$, then $\exists P \text{ with } B = P^{-1}AP$, so $A = PBP^{-1} = (P^{-1})^{-1}BP^{-1}$, and thus $B \sim A$. If $A \sim B$ and $B \sim C$, then $\exists P, Q \text{ with } B = P^{-1}AP \text{ and } C = Q^{-1}BQ$. A substitution gives $C = Q^{-1}(P^{-1}AP)Q = (PQ)^{-1}A(PQ)$, so $A \sim C$.

6. (15 pts) Let $\sigma \in S_n$, and assume that $\sigma$ has order $m$, where $m > 1$. Prove the result from the text which states that for positive integers $i, j$ we have $\sigma^j = \sigma^j$ if and only if $i \equiv j \pmod{m}$.

7. (10 pts) State the definition of a group.

8. (10 pts) Let $G = \{x \in \mathbb{R} \mid x > 1\}$ be the set of all real numbers greater than 1. For $x, y \in G$, define $x * y = xy - x - y + 2$.

(a) Show that 2 is the identity element for the operation $*$.

Solution: Since the operation is commutative, the one computation $2 * y = 2y - 2 - y + 2 = y$ suffices to show that 2 is the identity.

(b) Show that for element $a \in G$ there exists an inverse $a^{-1} \in G$.

Solution: Given any $a \in G$, we need to solve $a * y = 2$. This gives us the equation $ay - a - y + 2 = 2$, which has the solution $y = a/(a - 1)$. This solution belongs to $G$ since $a > a - 1$ implies $a/(a - 1) > 1$. Finally, $a * (a/(a - 1)) = a^2/(a - 1) - a - a/(a - 1) + 2 = (a^2 - a^2 + a - a)/(a - 1) + 2 = 2$.
